

FINAL PROJECT

Create an e-commerce website. You are free to choose what products your platform sells.

Your website is expected to have:

- At least 10 products;
- A main page that shows all products;
- An individual product description page for each product, each of which including:
 - Multiple product images;
 - A product description text;
 - An “Add to cart” button;
 - An input field that allows users to select the quantity to add to cart (numeric only).

In addition, your implementation **must** include:

- External CSS;
- A navigation bar, fixed at the top;
- At least one image per product;
- All styles applied through CSS classes;
- A custom, professional-looking font sans-serif style, for all text (Hint: Google Fonts can be a good resource to find a non-native font).
- Standardized and consistent design and layout across all pages.

Your website is **NOT** expected to have:

- Any functionality regarding user’s ability to add products to cart, checkout, or any other logic that is not possible via HTML and CSS exclusively.
- Any code other than HTML and CSS.

You are **NOT** allowed to:

- Use any libraries, frameworks, toolkits, or anything other than pure HTML and CSS.

As you implement your website, ensure you are following the good practices of UI design, per class discussions. Feel free to benchmark existing e-commerce websites for inspiration, and strive for professional-looking designs.

When done, you must submit your solution by:

1. Uploading your website to our FTP server, under a folder called “FinalProject”; and
2. Uploading all files in a zipped folder to the appropriate dropbox on E-Centennial.

Good luck!
